Container Connection Chooses Trinium Technologies TMS

Container Connection of Montebello selected Trinium Technologies to replace their existing enterprise system as part of an initiative to future proof their technology platform and establish a base from which to drive further innovation in their transport operations.

Container Connection selected a range of solutions provided by Trinium to run their sophisticated and growing operation. At the core of their deployment is the Trinium TMS, a specialized transportation management enterprise system for intermodal drayage operators. The Trinium TMS handles order management, dispatch and operations, driver settlements and invoicing providing a range of automated functions and managerial controls to support those activities.

Additionally, Container Connection decided to deploy a number of sub-modules provided by Trinium most notably, Trinium's Document Imaging module, the EDI module, the Weblink module, eModal module and the Event Management module to drive workflow and provide automated customer notifications.

"We selected Trinium simply because they have the best product on the market for intermodal drayage operators, no question." said Jim Horvitz, Vice President, Container Connection. "Since signing our agreement, I have been impressed by Trinium's ability to deliver on development and implementation services. Trinium met their commitments on time and generally exceeded my expectations. Together we achieved a very speedy and effective implementation."

"Container Connection is a terrific company said Michael Thomas, CEO of Trinium Technologies. "One, they are recognized by some of the largest BCO's as being tops in their field, two they have very high operational standards and three, their senior management get directly and intimately involved in their operations and the system implementation which shows they know their business and manage it closely. We consider ourselves fortunate to have them as a client."

Container Connection signed with Trinium in mid September 2004 and was live and fully operational on the system by mid November.
